**Chemical Properties**

Elements account for all matter in the world.  
Like you and me, birds and bees,  
Even all the grass and trees are made of elements.

You walk down the street and everything you see  
is made of elements.  
Elements, it’s made of.

Each element is made of only one kind of atom.  
In the periodic table all the elements are grouped  
by their chemical properties, properties, properties.

A liquid we all should know, H$_2$O, is made of elements.  
Elements, it’s made of.

During chemical reactions some atoms rearrange  
(Atoms in reactants)  
To form products with different properties  
and different names.

Like in photosynthesis,  
Atoms rearrange and names change.  
With chlorophyll, water, sunlight, C0$_2$;  
They change to sugar and O$_2$ for me and you.
